

ABSTRACT

A garment hanger includes a frame having two lateral side portions and an upper and intermediate neck portion formed by a peripheral beam. A hook or a snap ring is disposed on the frame for
5 attaching the frame to supporting members. The peripheral beam of the frame includes a non-circular cross section, such as a T-shaped cross section, to reinforce the frame, and to increase a bending strength of the frame. One or more rods may further be disposed in the neck portion to further reinforce the frame. The snap ring
10 includes a catch and a hook for locking the frame to the supporting members.
